LUIS ALVARO PIMENTEL TACURI

Python Backend Developer | FastAPI · PostgreSQL · Next.js
Potosí, Bolivia (UTC−4) · Open to remote roles
luiscontactojob2007@gmail.com | gokublackssj.github.io | github.com/Gokublackssj

SUMMARY

Python developer building full-stack web applications with FastAPI, PostgreSQL and Next.js. My projects focus on getting messy input (spreadsheets, PDFs, web forms) into a database safely: validation on client and server, duplicate detection, a human review step before anything is saved, and automated tests for backend and frontend. Code, documentation and design decisions are public on GitHub.

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript, SQL, HTML, CSS
Backend: FastAPI, Pydantic 2, SQLAlchemy 2, Alembic, psycopg 3, REST API design, cookie sessions, CSRF protection
Frontend: Next.js (App Router), React, Astro
Data: PostgreSQL, CSV/Excel/PDF processing (openpyxl, pypdf), web scraping with Playwright
Testing & tools: pytest, Playwright Test, node:test, Ruff, ESLint, Docker Compose, Git, GitHub Actions, n8n

PROJECTS

QuoteFlow — Quote import and review web app *Runs locally*
Python, FastAPI, SQLAlchemy, Alembic, PostgreSQL, Next.js, React, TypeScript, Docker Compose · github.com/Gokublackssj/quoteflow

- Built an import pipeline that parses CSV, XLSX and PDF files in an isolated process with size, row and time limits, validates every row and flags duplicates against the user's existing records.
- Designed a review screen in Next.js and TypeScript where users filter rows, accept or exclude them in bulk and correct single cells, with the original value kept visible; nothing is stored until the user confirms.
- Implemented cookie-based sessions with CSRF protection, Argon2 password hashing, login rate limiting and an audit log with pseudonymized emails; in production mode the API refuses to start with insecure settings.
- Added an n8n intake endpoint with bearer-token auth and an Idempotency-Key, so replayed requests never create duplicate batches. Schema managed with Alembic; 512 pytest tests on PostgreSQL, 46 frontend tests.

LeadFlow — Lead capture form and mini-CRM *Runs locally*
Python, FastAPI, Pydantic, SQLAlchemy, PostgreSQL, Next.js, TypeScript, Playwright · github.com/Gokublackssj/LeadFlow

- Designed a REST API to create, list, update and annotate leads, with paginated search by name or email, status filters and explicit status codes.
- Made submissions idempotent with unique event IDs and blocked duplicate emails per source with a hashed, normalized key; two identical concurrent requests return the existing lead instead of a server error.
- Built the Next.js CRM view with status changes, follow-up notes and a full status history; tested the API with pytest (148 tests) and the interface with 17 Playwright end-to-end tests.

Book Data Extractor Pro — Configurable web scraper (CLI) *Open source · MIT*
Python, Playwright, openpyxl, pytest, GitHub Actions · github.com/Gokublackssj/book-data-extractor-pro

- Command-line scraper with per-site JSON profiles that keep CSS selectors separate from the engine; exports to XLSX and Excel-ready CSV with formula injection neutralized, plus page limits and request delays.
- Parses prices as exact decimals, removes duplicates by normalized URL and logs failed items without stopping the run; unit tests run in GitHub Actions on Python 3.12 and 3.13.

luisdataworks — Bilingual portfolio site *Live*
Astro, TypeScript, GSAP, GitHub Actions, GitHub Pages · gokublackssj.github.io

- English/Spanish site with light and dark themes and no trackers or cookies, deployed to GitHub Pages by a GitHub Actions workflow. Links to two concept business websites, also on GitHub Pages and tested with Playwright.

EDUCATION

Universidad Autónoma Tomás Frías (UATF) — Potosí, Bolivia *Started 2026*
Computer Engineering (Ingeniería en Informática)
